[show in github](#)

---

### **dandan package**

Several convenient tools for python programming

#### **Events**

- 2020-10-10 [0.7.3] remove psutil in dependencies
- 2018-10-13 [0.7.2] fix bug for AttrDict call dict.update
- 2018-10-11 [0.7.1] optimize performance for AttrDict and fix bug
- 2018-10-11 [0.7.0] optimize performance for AttrDict
- 2018-05-21 [0.6.0] add interrupt decorator
- 2018-05-16 [0.5.8] fix bug for AttrDict member functions
- 2018-05-12 [0.5.7] improve code robustness
- 2018-05-11 [0.5.6] modify logger roll suffix is “%Y-%m-%d.log”
- 2018-05-07 [0.5.5] fix bug for md5 and sha1
- 2018-05-03 [0.5.4] fix bug for logger file utf8 encoding
- 2018-04-28 [0.5.3] fix bug for logger file
- 2018-03-23 [0.5.2] add default logger name as ‘dandan’
- 2017-12-13 [0.5.1] fix bug
- 2017-12-13 [0.5.0] add system.kill and execute timeout
- 2017-12-12 [0.4.2] fix bug for system.execute in callback mode
- 2017-12-11 [0.4.1] fix bug for system.execute return result with str
- 2017-12-10 [0.4.0] add getLogger method in logger
- 2017-11-29 [0.3.3] fix bug for put\_json in python3
- 2017-11-29 [0.3.2] add indent for dandan.value.put\_json

- 2017-11-19 [0.3.1] fix bug in dandan.value.length when given string length is zero
- 2017-11-19 [0.3.0] add function dandan.value.length
- 2017-11-17 [0.2.3] update document for project enhance AttrDict class
- 2017-11-15 [0.2.2] update document for project
- 2017-10-14 move to another github project
- 2017-06-25 add function system.clear
- 2017-06-23 add function system.getch
- 2017-06-23 Support python3
- 2017-06-23 Add TestCase

## 3.1 Submodules

## 3.2 dandan.value module

**class** dandan.value.**AttrDict** (dic={}, json\_string=None, \*args, \*\*kwargs)

Bases: *dict*

Use dict key as attr

### examples

```
1 data = Attrdict()
2
3 # after two lines are equal statement
4 data.key1 = 1
5 data["key1"] = 1
6
7
8 # default value also is Attrdict after line is allowed
9 data.key2.key.key.key = 5
10
11 # if plus or minus a number the default value is 0
12 data.key3 += 5
13 assest(data.key2 == 5)
```

enjoys!!!

**DICTIONARY\_ATTRS** = set(['\_\_class\_\_', '\_\_cmp\_\_', '\_\_contains\_\_', '\_\_delattr\_\_', '\_\_delitem\_\_',

**dict** ()

return dict object of current instance

### Returns:

- dict: convert from current instance

dandan.value.**get\_json** (filename)

Load file as pickle object

### Args:

- filename (string): local system filename

### Returns:

- object: if file is json data else None

`dandan.value.get_pickle(filename)`  
Load file as pickle object

**Args:**

- filename (string): local system filename

**Returns:**

- object: if file is pickled data else None

`dandan.value.is_number(number)`  
Test parameter is number True or False

**Args:**

- number (TYPE): any object

**Returns:**

- bool: True if number is float value or False

`dandan.value.length(string)`  
Get true size of string or char, char might be 1 or 2, string accumulate all of char

**example**

```
1 dandan.value.length("test string") == 11
2 dandan.value.length("") == 10
3 dandan.value.length(" test string") == 22
```

**Args:** string (string or char): requested

**Returns:** int: size of string or char

`dandan.value.md5(data=None, filename=None, encoding='utf8')`  
get data or file md5 checksum

**Args:**

- data (string, optional): string
- filename (string, optional): local system filename

**Returns:**

- string: md5 checksum

`dandan.value.number(num)`  
convert parameter to float or None

**Args:**

- num (TYPE): any object

**Returns:**

- float: num float value or None

`dandan.value.put_json(data, filename, indent=None)`  
Save object as json string to filename

**Args:**

- data (object): any can jsoned object

- filename (string): local system filename
- indent (None, optional): json indent width default None

`dandan.value.put_pickle(data, filename)`

Save object as pickle to filename

**Args:**

- data (object): any can pickled object
- filename (string): local system filename

`dandan.value.sha1(data=None, filename=None, encoding='utf8')`

get data or file sha1 checksum

**Args:**

- data (string, optional): string
- filename (string, optional): local system filename

**Returns:**

- string: sha1 checksum

## 3.3 dandan.query module

`dandan.query.html(url, **kwargs)`

get html string object by url

**User-Agent :** default “Mozilla/5.0 (Windows NT 6.1; Win64; x64; rv:52.0) Gecko/20100101 Firefox/52.0”  
modify User-Agent put to headers in kwargs

**Args:**

- url (string): requested http url
- kwargs
- timeout : set get timeout default 60
- headers : set http headers have User-Agent
- params : set http parameters
- retry : set retry count default 0
- encoding : page encoding default utf8
- method : set http method default get
- json : if True return json else return string

**Returns:** string: if request correct else None

`dandan.query.json(url, **kwargs)`

get json object by url familiar html if http return json or None

**Args:**

- url (string): requested http url
- \*\*kwargs: same as `html()`

**Returns:** json: if request correct else None

`dandan.query.local_ip()`  
get local ip address for IP V4

**Returns:**

- string: current machine ip

**TODO:** ip v6 not implement

`dandan.query.soup(url, **kwargs)`  
get BeautifulSoup object by url

**Args:**

- url (string): requested http url
- \*\*kwargs: same as `html()`

**Returns:** BeautifulSoup: if request correct else None

`dandan.query.whois(ip)`  
Get whois information (developing)

**Args:**

- ip (string): request for whois

**Returns:**

- AttrDict: if get whois correct else None

## 3.4 dandan.system module

`dandan.system.clear()`  
Clear console screen

`dandan.system.execute(command, callback=None, timeout=0)`  
Execute a system command return status and output

**Args:** command (TYPE): execute command command must not bash command callback (None, optional):  
callback function per output line

**Returns:** string: console output if callback is None int: execute exit code

`dandan.system.getch()`  
Get a char pressed on keyboard without press Enter

**Returns:** char(s): return pressed key

`dandan.system.is_linux()`  
Check os platform is linux

**Returns:** bool: True if is linux else False

`dandan.system.is_python2()`  
Check current interpreter is python2

**Returns:** bool: True if is python2 else False

`dandan.system.is_python3()`  
Check current interpreter is python3

**Returns:** bool: True if is python3 else False

`dandan.system.is_win32()`

Check os platform is win32

**Returns:** bool: True if is win32 else False

`dandan.system.kill(pid)`

Kill progress with pid

**Args:** pid (int): progress id

`dandan.system.kill_command(command)`

Kill progress with command

**Args:** command (string): run command

`dandan.system.readable(path)`

Check if a given path is readable by the current user.

**Args:** path (string): local system path

**Returns:** bool: True if readable else False

`dandan.system.set_unicode()`

Set default encoding to utf8

`dandan.system.writeable(path, check_parent=True)`

Check if a given path is writeable by the current user.

**Args:**

- path (string): local system path
- check\_parent (bool, optional): If the path to check does not exist, check for the ability to write to the parent directory instead

**Returns:**

- bool: True if writeable else False

## 3.5 dandan.traffic module

`dandan.traffic.download(url, filename, callback=None, force=False, headers={},  
check_length=False)`

Download http file to filename

**Args:**

- url (string): http url for download
- filename (string): local system filename to save file
- callback (function, optional): callback function when file downloading
- force (bool, optional): redownload if filename exists default False
- headers (dict, optional): http headers
- check\_length (bool, optional): Check length for downloaded file and http headers content-length

**Returns:**

- bool: success status

- string: file length if correct else error information
- int : spend time for download period

`dandan.traffic.upload(filename, url, callback=None, **kwargs)`

Upload filename to url

**Args:**

- filename (string): local system filename to upload
- url (string): http url
- callback (function, optional): callback function when file downloading
- kwargs: parameters for http

**Returns:**

- bool: success status
- string: url return content if correct else error information
- int : spend time for download period

## 3.6 dandan.logger module

`dandan.logger.getLogger(name='dandan', level=10, filename=None, backup_count=10)`

Get logger for convenient method

**Args:**

- name (string): logger name, default as 'dandan'
- level (logger level, optional): level of this logger such as DEBUG, INFO, WARNING, ERROR, FATAL
- filename (string, optional): filename for timerotatedlogger
- backup\_count (int, optional): file backup count, if file count larger than count, then oldest file will be deleted.

**Returns:**

- logger: the logger named name

## CHAPTER 4

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`

### d

- `dandan.__init__`, 5
- `dandan.logger`, 11
- `dandan.query`, 8
- `dandan.system`, 9
- `dandan.traffic`, 10
- `dandan.value`, 6

## A

`AttrDict` (class in `dandan.value`), 6

## C

`clear()` (in module `dandan.system`), 9

## D

`dandan.__init__` (module), 5

`dandan.logger` (module), 11

`dandan.query` (module), 8

`dandan.system` (module), 9

`dandan.traffic` (module), 10

`dandan.value` (module), 6

`dict()` (`dandan.value.AttrDict` method), 6

`DICT_ATTRS` (`dandan.value.AttrDict` attribute), 6

`download()` (in module `dandan.traffic`), 10

## E

`execute()` (in module `dandan.system`), 9

## G

`get_json()` (in module `dandan.value`), 6

`get_pickle()` (in module `dandan.value`), 7

`getch()` (in module `dandan.system`), 9

`getLogger()` (in module `dandan.logger`), 11

## H

`html()` (in module `dandan.query`), 8

## I

`is_linux()` (in module `dandan.system`), 9

`is_number()` (in module `dandan.value`), 7

`is_python2()` (in module `dandan.system`), 9

`is_python3()` (in module `dandan.system`), 9

`is_win32()` (in module `dandan.system`), 9

## J

`json()` (in module `dandan.query`), 8

## K

`kill()` (in module `dandan.system`), 10

`kill_command()` (in module `dandan.system`), 10

## L

`length()` (in module `dandan.value`), 7

`local_ip()` (in module `dandan.query`), 8

## M

`md5()` (in module `dandan.value`), 7

## N

`number()` (in module `dandan.value`), 7

## P

`put_json()` (in module `dandan.value`), 7

`put_pickle()` (in module `dandan.value`), 8

## R

`readable()` (in module `dandan.system`), 10

## S

`set_unicode()` (in module `dandan.system`), 10

`sha1()` (in module `dandan.value`), 8

`soup()` (in module `dandan.query`), 9

## U

`upload()` (in module `dandan.traffic`), 11

## W

`whois()` (in module `dandan.query`), 9

`writable()` (in module `dandan.system`), 10
